What does Roadmap Viewer offer?

It's a starting point.

- The Roadmap Viewer contains procedures and methods that help you to bring improvements and innovations into your company. The SAP roadmaps are organized based on their general or product-specific relevance.

- The selected SAP roadmap gives you a general overview of the usage and goals. You can structure the SAP roadmaps by phases, work streams, or services. The results are presented as activities, deliverables, and tasks.

- If the selected roadmap is relevant for you, choose the attached project plan and upload it into SAP Solution Manager - project management. The result is a project plan in the form of a work breakdown structure that you can use as starting point for project delivery.
In software implementation, the methodology (often referred to as the Implementation Roadmap) represents a structured approach to the software implementation process. It allows work to be split into distinct phases, with deliverables and tasks, that help project teams to better plan, execute, and manage their implementation project.

A SAP Activate Methodology Implementation Roadmap aims to assist by providing implementation project teams with a recommended list of deliverables (the “what”) in each phase, a process description in the form of tasks (the “how”), and accelerators (such as templates, examples, guides and web links) in a user friendly format - helping implementations to run simple.
