Configuration Validation

Configuration Validation provides a reporting to understand how homogeneous the configuration of systems is.

Scope
- Configuration Validation provides a reporting to understand how homogeneous the configuration of systems is. Using centrally stored configuration data in Solution Manager to perform a configuration validation of a large number of systems using a subset of the collected configuration data.

Benefits
- Configuration validation enables you to determine whether the systems in your landscape are configured consistently and in accordance with your requirements.
- Typical questions are:
  - All systems on a certain OS level or DB level?
  - Template configuration (SAP or DB parameter) applied on all systems?
  - No kernel older than 6 months on all systems?
  - Security policy settings applied? Security defaults in place?
