Retrofit – Dual Landscape Synchronization

The Retrofit capability automatically synchronizes two or more development systems. For example if implementation projects or upgrades are done in parallel to production support.

Scope
- Automatic synchronization of two or more ABAP based development systems
- Support for all transportable objects, including customizing and workbench objects
- Can be used in implementation and upgrade projects
- Customizing and BADIs for customer specific requirements

Benefits
- No manual effort for the synchronization of two or more development systems
- No risk of landscape inconsistencies due to forgotten double maintenance
- Automatic conflict detection and resolution if the same object was changed in different development systems
- Complete logging of all retrofit activities
